

KMC+LUCAS Website

One-page repo summary generated from local code evidence only

Static HTML/CSS/JS

Multi-page site

React lab subproject

WHAT IT IS

A static multi-page marketing website for KMC+LUCAS, a media production company. It showcases the studio brand, selected work, the Surviving Silicon Valley project, company background, and contact entry points.

WHO IT IS FOR

Prospective clients, collaborators, and viewers exploring KMC+LUCAS services, projects, and media channels.

WHAT IT DOES

- Presents a branded home page with hero media, animated storytelling blocks, services, and contact links.
- Publishes a dedicated Work page with featured projects and links to individual case-study pages.
- Highlights Surviving Silicon Valley on its own page with masked video, timeline storytelling, and event sections.
- Provides an About page with philosophy, approach, impact, and founder profile content.
- Offers case-study pages for Stanford, real estate, Q3D, winery, and Aloe Blacc work, including video playback where configured.
- Links out to social channels and surfaces a contact form UI for inbound interest.

HOW IT WORKS

- Pages: index.html, work.html, ssv.html, about.html, and multiple case-*.html files route users across the site with normal hyperlinks.
- Styling: shared CSS layers such as tokens.css, base.css, nav.css, menu.css, and styles.css are combined with page-specific styles.
- Behavior: vanilla JS files drive page transitions, menu drawers, hover states, reveal effects, scroll locks, and case/video interactions.
- Animation stack: the main site loads GSAP, ScrollTrigger, ScrollToPlugin, and Lottie from CDN; the Work page also uses IntersectionObserver heavily.
- Assets: local images, SVGs, logos, and video live under assets/, especially assets/ssv/ and assets/ssv-timeline/; some media references point to Figma-hosted asset URLs.
- Data flow: content is embedded directly in HTML and local assets; no API layer, CMS, or form submission backend was found in repo.
- Experimental branch: scroll-editorial/ is a separate React 19 + Vite + Framer Motion project for scroll animation experiments.

HOW TO RUN

- Main site: open index.html in a browser. No build step for the static site was found in repo.
- Navigate to linked pages directly, or open work.html, ssv.html, about.html, and case-study pages as standalone files.
- Optional experiment: cd scroll-editorial, run npm install, then npm run dev. Use npm run build for a production bundle.

REPO NOTES

- Primary fonts/color guidance in AGENTS.md does not fully match current index.html imports; the PDF summary reflects repo evidence, not intended design docs.
- Contact handling backend: Not found in repo.
- Primary deployment target or hosting service: Not found in repo.
